

CHAPTER 1

INFocus

HEALTHY COMPUTING

Working with computers involves more than just using software and hardware. This chapter focuses on aspects that must be considered to ensure that employees' working conditions are both safe and healthy.

In this session you will:

- ✓ gain an understanding of how to set up a workstation ergonomically
- ✓ gain an understanding of exercises you can do while working at a computer
- ✓ gain an understanding of anti-glare and radiation reduction monitors
- ✓ gain an understanding of what constitutes a good computing work environment
- ✓ gain an understanding of social problems that are associated with computer addiction.

SETTING UP AN ERGONOMIC WORKSTATION

Many of the office-based injuries to the neck, arm and wrist can be prevented by having a properly set up workstation. This section presents some guidelines for you to work with in setting up a

safe computer workstation. However, common sense must always prevail and if you feel any pain or discomfort as a result of using a computer you should stop immediately.

1 Chair

The chair should be a gas-adjustable type chair. Adjust the height of the chair so that feet are comfortably flat on the floor, the thighs are approximately horizontal and the lower legs approximately vertical. Position the backrest to the curve of the back – if not comfortable, lower the height several centimetres and try this position.

1

2 Arm Rests

Arm rests are usually not recommended unless they are well out of the way.

3 Desk

Having adjusted the chair as above, adjust the height of the desk (where available) so that the top surface is just below elbow height. Ensure that there is ample clearance under the desk and that the desk is not too cluttered.

3

4 Keyboard

The common and preferred setting for the keyboard is where the feet (under the keyboard) are lowered so that the keyboard sits flat on the desk. Place the keyboard as close to the front of the desk as is comfortable so that the top half of the arms are approximately vertical.

5 Mouse

Place the mouse directly beside the end of the keyboard. When your hand is on the mouse, place your forearm on the desk or on a wrist rest if you find the edge of the desk painful. Try to use the mouse both left-handed and right-handed and change hands regularly.

6

6 Screen

Position the screen after you have positioned the chair and desk. The top of the screen should be level with or slightly lower than your eyes. It should be at an arm's length away from the user. Position the screen to avoid reflective glare from windows and lights.

7 Document Holder

Try to place documents so that they are at eye level and just to the side of the screen.

8 Laptop Computer

If you use a laptop for more than 2 hours per day connect a separate mouse and LCD screen and position both as directed above.

ACTIVITY – ERGONOMIC WORKSTATIONS

Individual
Activity

Group
Activity

Setting Up An Ergonomic Workstation

Have a think about the workstation components listed below and circle whether you think they're ergonomic or no.

Workstation Component	Ergonomic?
If you use a document holder, it should be placed just to the side of the monitor at eye level	Yes – No
The mouse should be placed on the desk approximately above your knee	Yes – No
Position the keyboard as close to the front of your desk as possible	Yes – No
When you look at the centre of your monitor, your eyes should be looking down at an angle of approximately 30°	Yes – No
The best office chairs are gas-adjustable and include arm rests	Yes – No
If you're using a laptop for more than 2 hours per day, connect a separate mouse, LCD monitor and keyboard	Yes – No
It doesn't matter which side you position a document holder as long as it is positioned just to the side of your monitor	Yes – No
Get the position of your monitor correct and then position the chair and desk	Yes – No
It is good to use the mouse both left-handed and right-handed even if you are right-handed	Yes – No
Adjust the height of your chair until your thighs are angled at approximately 30° below horizontal	Yes – No
Position the monitor so that it avoids reflective glare from windows and overhead lights	Yes – No
Adjust the backrest of your chair so that it is positioned in the curve of your back	Yes – No
The correct height of your desk places its top surface just above elbow height	Yes – No
When you sit at your desk, your top half of your arms and lower legs should be approximately vertical	Yes – No

BREAKS AND EXERCISES

Prevention is definitely better than cure when it comes to any form of illness or injury. Here are a number of suggestions for rest breaks and stretching exercises for you to try while working

at the computer. Make sure that you relax and perform the exercises gently. You should stop immediately if you feel any discomfort.

Rests and Breaks

- Take a rest break away from the computer for 5 to 10 minutes every hour.
- Active rest during a break with some other type of activity, such as walking or stretching, is more beneficial than passive rest – get up off your chair and walk to the printer to collect those print jobs!
- Vary activities where possible interspersing computer tasks with non-computer tasks.
- Try to limit computer time to 5 hours per day – break this time up into segments.

Exercises

Head Rolls

Gently lower ear to shoulder and hold for 10 seconds. Slowly roll chin to chest and up to other shoulder and hold chin for 10 seconds. Repeat several times and be careful not to extend your neck back too far.

Neck Stretch

Head Turns

Head Turns

Turn head to look over left shoulder and hold for 10 seconds. Turn head the other way and hold for 10 seconds. Repeat several times.

Shoulder Rolls

Circle shoulders forward several times, then backwards. Repeat 3 to 5 times.

Shoulder Rolls

Wrist Stretch

Wrist Stretch

Interlace fingers, palms outwards, and straighten arms in front. Hold for 10 seconds and repeat several times.

Upper and Lower Back Stretch

Interlace fingers and turn palms upward above head, straighten arms then slowly lean slightly from side to side. Repeat movement several times.

Upper and Lower Back Stretch

Back Arching

Back Arching

Stand up and support your lower back with your hands then gently arch for five to ten seconds.

For a comprehensive range of exercises for office workers refer to **Appendix B** in *Officewise: A Guide to Health and Safety in the Office* published by **WorkSafe Victoria**. You can download a copy from the download link on the home page of **WorkSafe Victoria** (<http://www.worksafe.vic.gov.au>).

RESEARCH – BREAKS AND EXERCISES

Individual
Activity

Group
Activity

Research Task

At Work	If you are currently employed and sit for long periods at a desk, describe 3 types of exercises or breaks that you do during the day. If you don't sit for long periods, speak to someone who does so that you can complete this exercise.
At School	If you are still at school, ask an adult who is currently employed and who sits for long periods at a desk to describe 3 types of exercises or breaks that they do during the day.

Exercise or Break

3.

HEALTHIER COMPUTER SCREENS

Two types of computer monitors are currently available: the box-shaped CRT (cathode-ray tube) monitor and the thin, flat-screened LCD (liquid crystal display) monitor. Of these, the LCD

monitors are considered the healthier choice when it comes to minimising radiation exposure and reducing eye fatigue as you'll see here.

Computer Monitors And Radiation

Electromagnetic radiation is all around us. It is emitted from power lines, electrical sub-stations, TVs, and other electrical and electronic appliances such as electric blankets and hair driers.

But if you are a computer user and spend your entire working day sitting in front of a computer screen, the radiation emitted from your computer and its various components may be your largest source of electromagnetic radiation. This could especially be the case if you sit close to and use a **CRT monitor**.

CRT monitors are designed to emit visible radiation (light) to create the display. But as well as emitting light, they also emit small amounts of other types of electromagnetic radiation. This radiation is also emitted (and in greater concentrations) from the sides and back of these monitors as well. **LCD monitors**, on the other hand, emit virtually no radiation, either from their fronts or backs.

There are many claims that the electromagnetic radiation emitted from computers can be harmful causing health problems such as eye problems, reproductive problems and cancer. Although these claims are not supported by scientific research findings or reliable epidemiological studies at this time (according to Worksafe's *A Guide to health and safety in the office*), we all know that electromagnetic radiation isn't good for us and that we should try to minimise our exposure to it whenever possible. And when dealing with computer screens, we can!

To minimise your exposure to radiation from your computer, change to using an LCD monitor. But if you still have to use a CRT monitor, move it as far away from you as possible and ensure that you are not located closer to the sides or rear of another user's CRT monitor than you are to your own.

Anti-glare Computer Screens

An anti-glare computer screen is designed to cut down on the amount of light that reflects off the screen. Reflected light (or glare) is very fatiguing to the eyes and reduces the contrast, colours and sharpness of the display. An anti-glare computer screen makes viewing a display more pleasant, reduces eyestrain (general soreness or redness of the eyes) and sharpens the picture.

Most **LCD monitors** come standard with an anti-glare computer screen with either a matte or glossy finish. Both finishes have different advantages and disadvantages.

Matte This is the most common finish. This anti-glare computer screen works by using a rough matte surface to scatter light, rather than allowing it to reflect off a smooth surface. As a result of this, these screens don't get glare or reflections on them. However, this rough surface also scatters light coming out of the display which means that images will appear with less contrast and brightness and even slightly blurry to the viewer, which in itself is fatiguing to the eyes.

Glossy Glossy screens use a chemical coating over a smooth surface to cut down glare. Because of their smooth high gloss surface, glossy screens have vibrant colours and the highest contrast and brightness. Glossy screens are considered best for viewing movies and photographs and for gaming. However, strong lighting causes glare on these screens which is both annoying and tiring on your eyes if you have to stare at it all of the time. You can also see reflections on these screens.

A good way to choose between matte or glossy anti-glare computer screens is to consider the environment in which you will be using the computer. A glossy screen is probably well-suited for home use where there is mostly ambient light that you can control. In the workplace, where harsh overhead lighting is common, it may be less fatiguing to cut more glare with a matte finish than to maintain a crisper picture with a glossy display that will reflect more light.

Some **CRT monitors** also come with an anti-glare screen. If not, you can purchase an aftermarket anti-glare filter that blocks not only glare, but also harmful ultra-violet (UV) radiation. (UV radiation is not a problem with LCD screens.) Aftermarket anti-glare computer filters are available virtually everywhere computers are sold. Be sure to choose the right size for your display, and if buying for a CRT monitor, look for 100% UV blockage along with anti-glare properties.

ACTIVITY – HEALTHIER COMPUTER SCREENS

Individual
Activity

Group
Activity

Computer Screens

Have a think about the following and write your answers in the space provided beneath each question.

1.	If you could choose between using a CRT monitor and an LCD monitor, which one would you choose? Why?
2.	If you and the three people who share your office all use CRT monitors, what can you do to minimise your exposure to electromagnetic radiation?
3.	If you work in an office environment with a large amount of overhead lighting, which LCD monitor would be easier to use – matte or glossy? Why?
4.	If you spend a lot of your day looking at images and photographs, which LCD monitor would be best to use – matte or glossy? Why?

A GOOD WORKING ENVIRONMENT

In addition to setting up for good posture at your computer workstation it is important that the environment and the ambience surrounding the workstation are conducive to healthy and safe

computing. Environmental factors include such things as lighting, noise, ventilation, space and storage, equipment safety, and the like.

Lighting and Glare

To avoid excessive reflections and glare a computer user should not be facing an uncovered window. If a window is uncovered the workstation should be positioned at right angles to the window.

With regard to lights, a computer monitor should be positioned to the side of a light source and not underneath it. If the monitor is well away from windows and there are no other sources of bright light you should use a low level of service light of 300 lux*. If the room has strongly contrasting light levels, then a moderate level of lighting of 400 – 500 lux may be desirable.

Noise

Excess noise can be distracting to a computer user. Excessive noise around a workstation can be filtered out using portable panels and partitions, double glazing on windows, noise cancelling headphones, and the like. You can also download specialist software, such as **ChatterBlocker** which purports to reduce distraction from nearby conversations by blurring it using a blend of soothing nature sounds, music and background chatter.

Ventilation, Heating and Cooling

A comfortable working environment leads to better concentration and therefore productivity. Computers and their peripheral devices such as printers can produce fumes and heat. It is important therefore that the workplace has adequate ventilation to prevent these fumes from causing health problems.

It is important to maintain a comfortable level of heating and cooling, dependent upon the location and the season.

Space and Storage

Your workstation should be able to accommodate all of the items and equipment that you need to do your work. Your desk should have enough space for items such as a keyboard, mouse, document holder, telephone, pens, and other items that you would use during the normal course of your work. If you work from books or document the desk should be large enough for you to work from these without too much clutter. If your desk is not large enough to do this, then you could consider having a side table for items that are not used or accessed that frequently.

Keyboarding from Documents

When keyboarding from documents a good document holder should be used. Touch typists should use an A4 document holder placed level with and close to one side of the screen. Non touch typists should use an A3 document holder above the keyboard and in front of the screen.

Computer Radiation

All computer monitors emit low levels of radiation that may affect your health. You should avoid sitting to the side or back of monitors and keep at least one metre away. Where possible use liquid crystal display (LCD) monitors as these emit less radiation than older style CRT monitors. If you use an older style CRT monitor use a radiation filter screen over the front of the monitor to reduce the rays emitted. Monitors should be turned off when not in use.

Equipment Safety

Computers are electrical devices and therefore have cabling associated with them. Cabling can present both a tripping and an electrical hazard at the workplace. All electrical devices, including computers, should be electrically tested periodically to ensure that they are safe and working correctly. Cables should not be placed where they present a tripping hazard – dangerous and exposed cables should always be re-routed by an electrician.

Older style double adaptors should be avoided, as should overloading a powerboard with too many appliances. These pose significant office fire risks.

*Lux is a unit of measure used to measure the illuminance and luminosity of light output.

SOCIAL PROBLEMS OF COMPUTER ADDICTION

While most people find spending some time online to be productive, compulsive internet use can interfere with work, relationships and daily life. When you feel more comfortable with your

online friends than your real ones or you can't stop playing games, gambling or surfing compulsively, even when it has negative consequences in your life, then you may be using the internet too much.

What Is Computer Addiction?

Computer addiction (also known as internet addiction or online addiction) is the name given to a variety of problems including:

- *net compulsions* such as compulsive online gaming (like World Of Warcraft), stock trading or compulsive use of online auction sites such as eBay, often resulting in financial and job-related problems
- *cyber-relationship addiction* such as addiction to social networking, chat rooms and messaging to the point where virtual, online friends become more important than real-life relationships with family and friends
- *computer addiction* such as obsessive playing of offline computer games (like Solitaire or Minesweeper) or obsessive computer programming
- *cybersex addiction* such as compulsive use of internet pornography, adult chat rooms or adult fantasy role-play sites impacting negatively on real-life intimate relationships.

Symptoms Of Computer Addiction

Signs and symptoms of computer addiction vary from person to person, but some general warning signs that your internet use may have become a problem include the following.

- *Losing track of time while online* – Do you frequently find yourself on the internet longer than you intended? Does a few minutes turn into a few hours? Do you get irritated or cranky if your online time is interrupted?
- *Having trouble completing tasks* – Do you find yourself working late more often because you can't complete your work on time? Do you find laundry piling up or no dinner on the table because you've been busy online?
- *Isolation from family and friends* – Is your social life suffering because of the time you spend online? Are you neglecting your family and friends? Do you feel like no one in your 'real' life, even your spouse, understands you like your online friends?
- *Feeling guilty or defensive about your internet use* – Are you sick of your spouse nagging you to get off the computer and spend time together? Do you hide your internet use or lie to your boss and family about the amount of time you spend on the computer and what you do while you're online?
- *Feeling a sense of euphoria while online* – Do you use the internet as an outlet when stressed, sad, or for sexual gratification or excitement? Have you tried to limit your internet time but failed?

How Do People Become Addicted And How Can They Overcome It?

Many people turn to the internet in order to manage unpleasant or overwhelming feelings such as stress, loneliness, depression, anxiety and boredom. Losing yourself online can temporarily make these feelings evaporate into thin air.

But as much comfort as the internet can provide, it's important to remember that there are healthier and more effective ways to keep difficult feelings in check – for example, exercise, meditation, sensory relaxation strategies, and simple breathing exercises. For many people, the best way to overcome internet and computer addiction is to find alternative ways to handle these difficult feelings, such as going to the gym or spending time with friends.

Even when your internet use is back to healthy levels, the painful and unpleasant feelings that may have prompted you to engage in unhealthy internet use in the past will remain. So, it's worth spending some time thinking about different ways that you can deal with stressful situations and the daily irritations that would normally trigger you to log onto the internet.

CHAPTER 2

INFocus

COMPUTER HARDWARE

The most obvious part of a computer is its physical being – its existence. A computer is simply a box of wires, nuts, bolts and other sundry bits and pieces that you can touch, hold and pull apart. The physical items that make up a computer are known as the computer's **hardware**.

In this session you will:

- ✓ gain an understanding of the different types of computers
- ✓ gain an overview of the main parts of a personal computer
- ✓ gain an understanding of computer peripherals
- ✓ gain an understanding of how external devices are connected
- ✓ gain an understanding of how you can wirelessly connect peripherals .

TYPES OF COMPUTERS

Modern, electronic computers have been in commercial use since the mid-1960s. There are many different types of computer ranging from very large and powerful server and mainframe

computers through to very small and personal hand held computers, such as smartphones which are built on a mobile computing platform. The more common types of computers are detailed below.

Personal Computers

Personal computers were developed in the late 1970s and are used by an individual (hence the name *personal*). Traditionally, personal computers consisted of several pieces of equipment used together, including the systems unit, monitor (screen), keyboard and mouse. Nowadays, though, personal computers come in a variety of forms including desktop computers, laptops, tablets and smartphones.

While personal computers offer personal freedom and independence, it is often important for users of personal computers to share data and information with other people. To allow this to happen, personal computers can be networked or joined together. This is normally done using either cables running between the computers or with wireless technology where no cables are necessary.

Server Computers

Server computers are generally more powerful than personal computers and are used to provide functionality to a number of users at once over a network. If you work in an office, a server may be providing you with access to your email, user account and shared files. When you view a website on the internet it will be sent to you from a server computer, which might also be sending the same website to thousands of other people at the same time.

Mainframe Computers

Mainframe computers are high performance computers used for large scale computing purposes that require greater availability and security than smaller scale computers can offer. They were once very popular with large organisations for processing enormous amounts of information and data, but with the explosion of computing power and lower prices of general purpose computers, they are now mainly used by banks and governments who really need their speed and accuracy. You are unlikely to encounter a mainframe computer in your day-to-day activities.
